Project Summary:

The website is an informative resource for people who want to discover one of the beautiful park in the world named Yellowstone Park . This is really an experience of a lifetime.

Content:

HomeGeneral information about Yellowstone area, history and images .

About area.....is about the supervolcano, eruptive cycle and some important events

Location.....General information about the place and its geographic localisation

Forest.....is more about the fauna and flora, the ecosystem and the exotic species.

Wildlife.....is about the different types of animals found there (images).

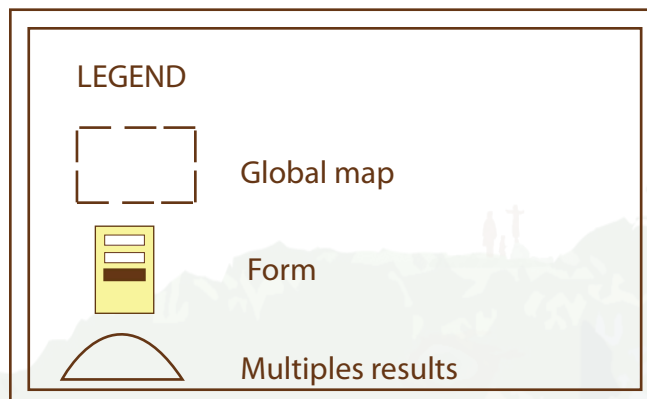

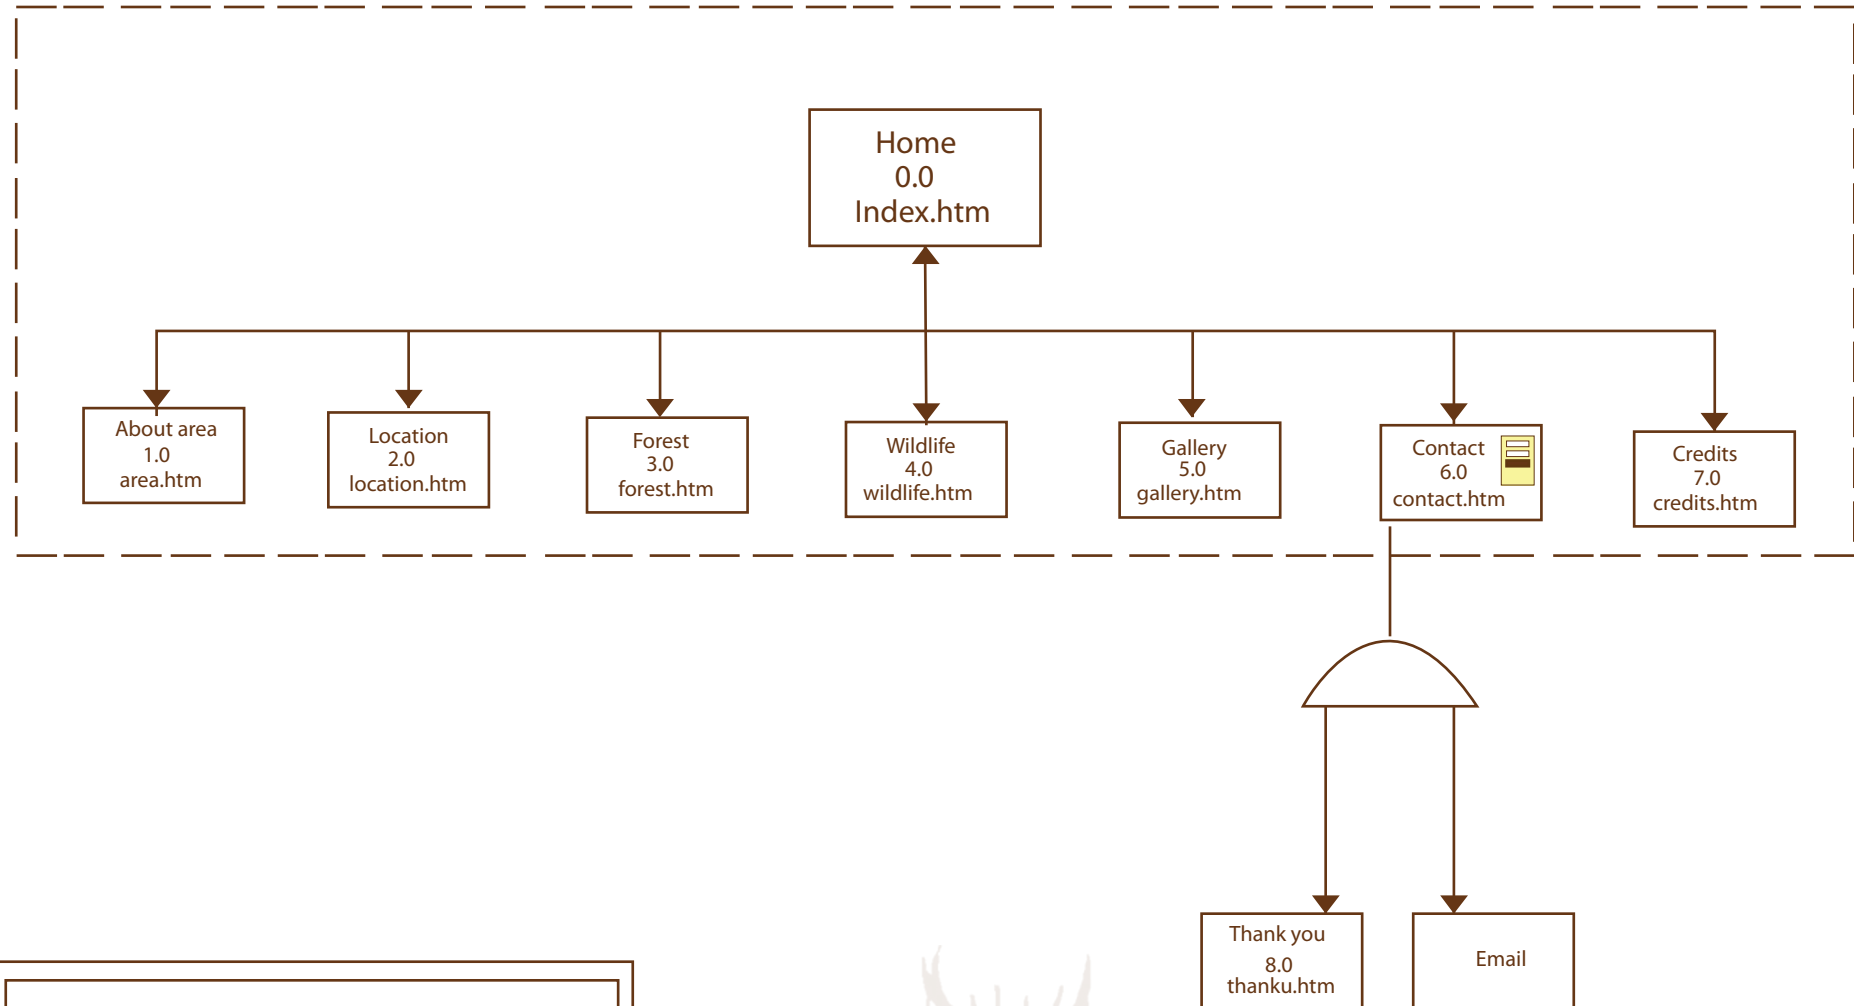

GalleryImages thumbnails about all the yellowstone park that the viewer can enlarge

Contact.....Allow visitors to fill up a contact form and send it to the webmaster. They will be redirected to a thank you page that confirms that it has been successfully sent.

Credits.....A list of all references of the sites.

Audience Profile: This site is mainly for children older than 12 years old, youth and adults who want to discover an exciting place and have fun.

Perception/Tone: Exciting, alive, well organized and informative.

Introduction to Yellowstone National Park

Hundreds of species of mammals, birds, fish and reptiles have been documented, including several

stone.png

that are either endangered or threatened. The vast forests and grasslands also include unique speof plants. Grizzly Bears, wolves, and free-ranging herds of bison and elk live in the park. Forest fires occur in the park each year; in the large forest fires of 1988, nearly one third of the park burned.

Yellowstone has numerous recreational opportunities, including hiking, camping, boating, fishing and sightseeing. Paved roads provide close access to the major geothermal areas as well as some of the lakes and waterfalls. During the winter, visitors often access the park by way of guided tours that use either snow coaches or snowmobile.

About the Area

Falls.jpg

Supervolcano:

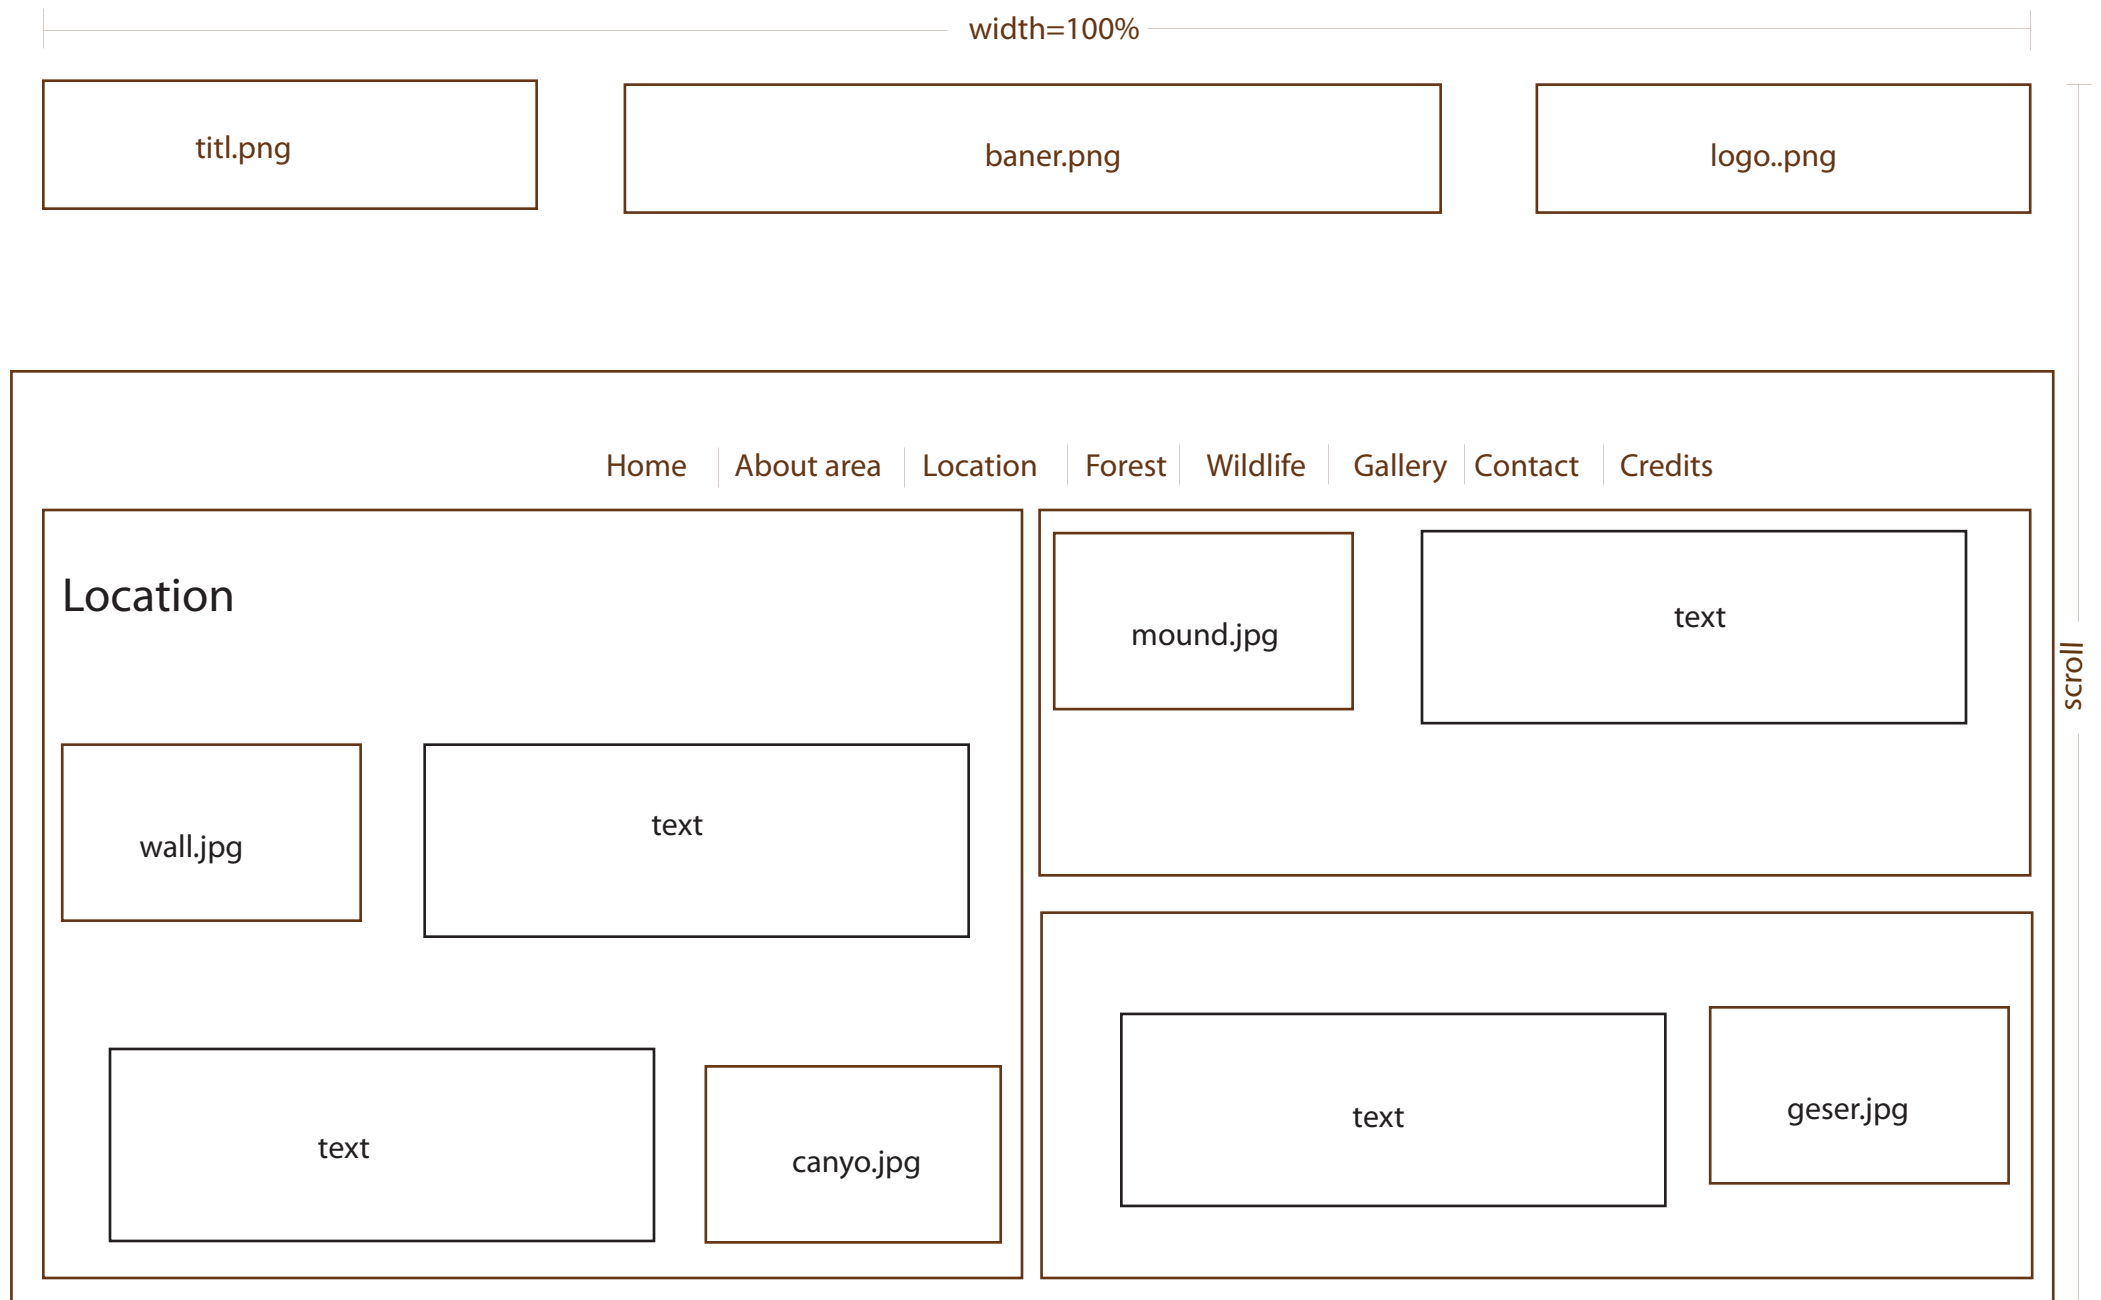

The Yellowstone Caldera is the largest volcanic system in North America. It has been termed "supervolcano" because the caldera was formed by exceptionally large explosive eruptions. The current caldera was created by a cataclysmic eruption that occurred 640,000 years ago, which released 240 cubic miles (1,000 km³) of ash, rock and pyroclastic materials. This eruption was 1,000 times larger than the 1980 eruption of Mount St. Helens.[50] It produced a crater nearly a two thirds of a mile (1 km) deep and 52 by 28 miles (84 by 45 km) in area and deposited the Lava Creek Tuff, a welded tuff geologic formation.

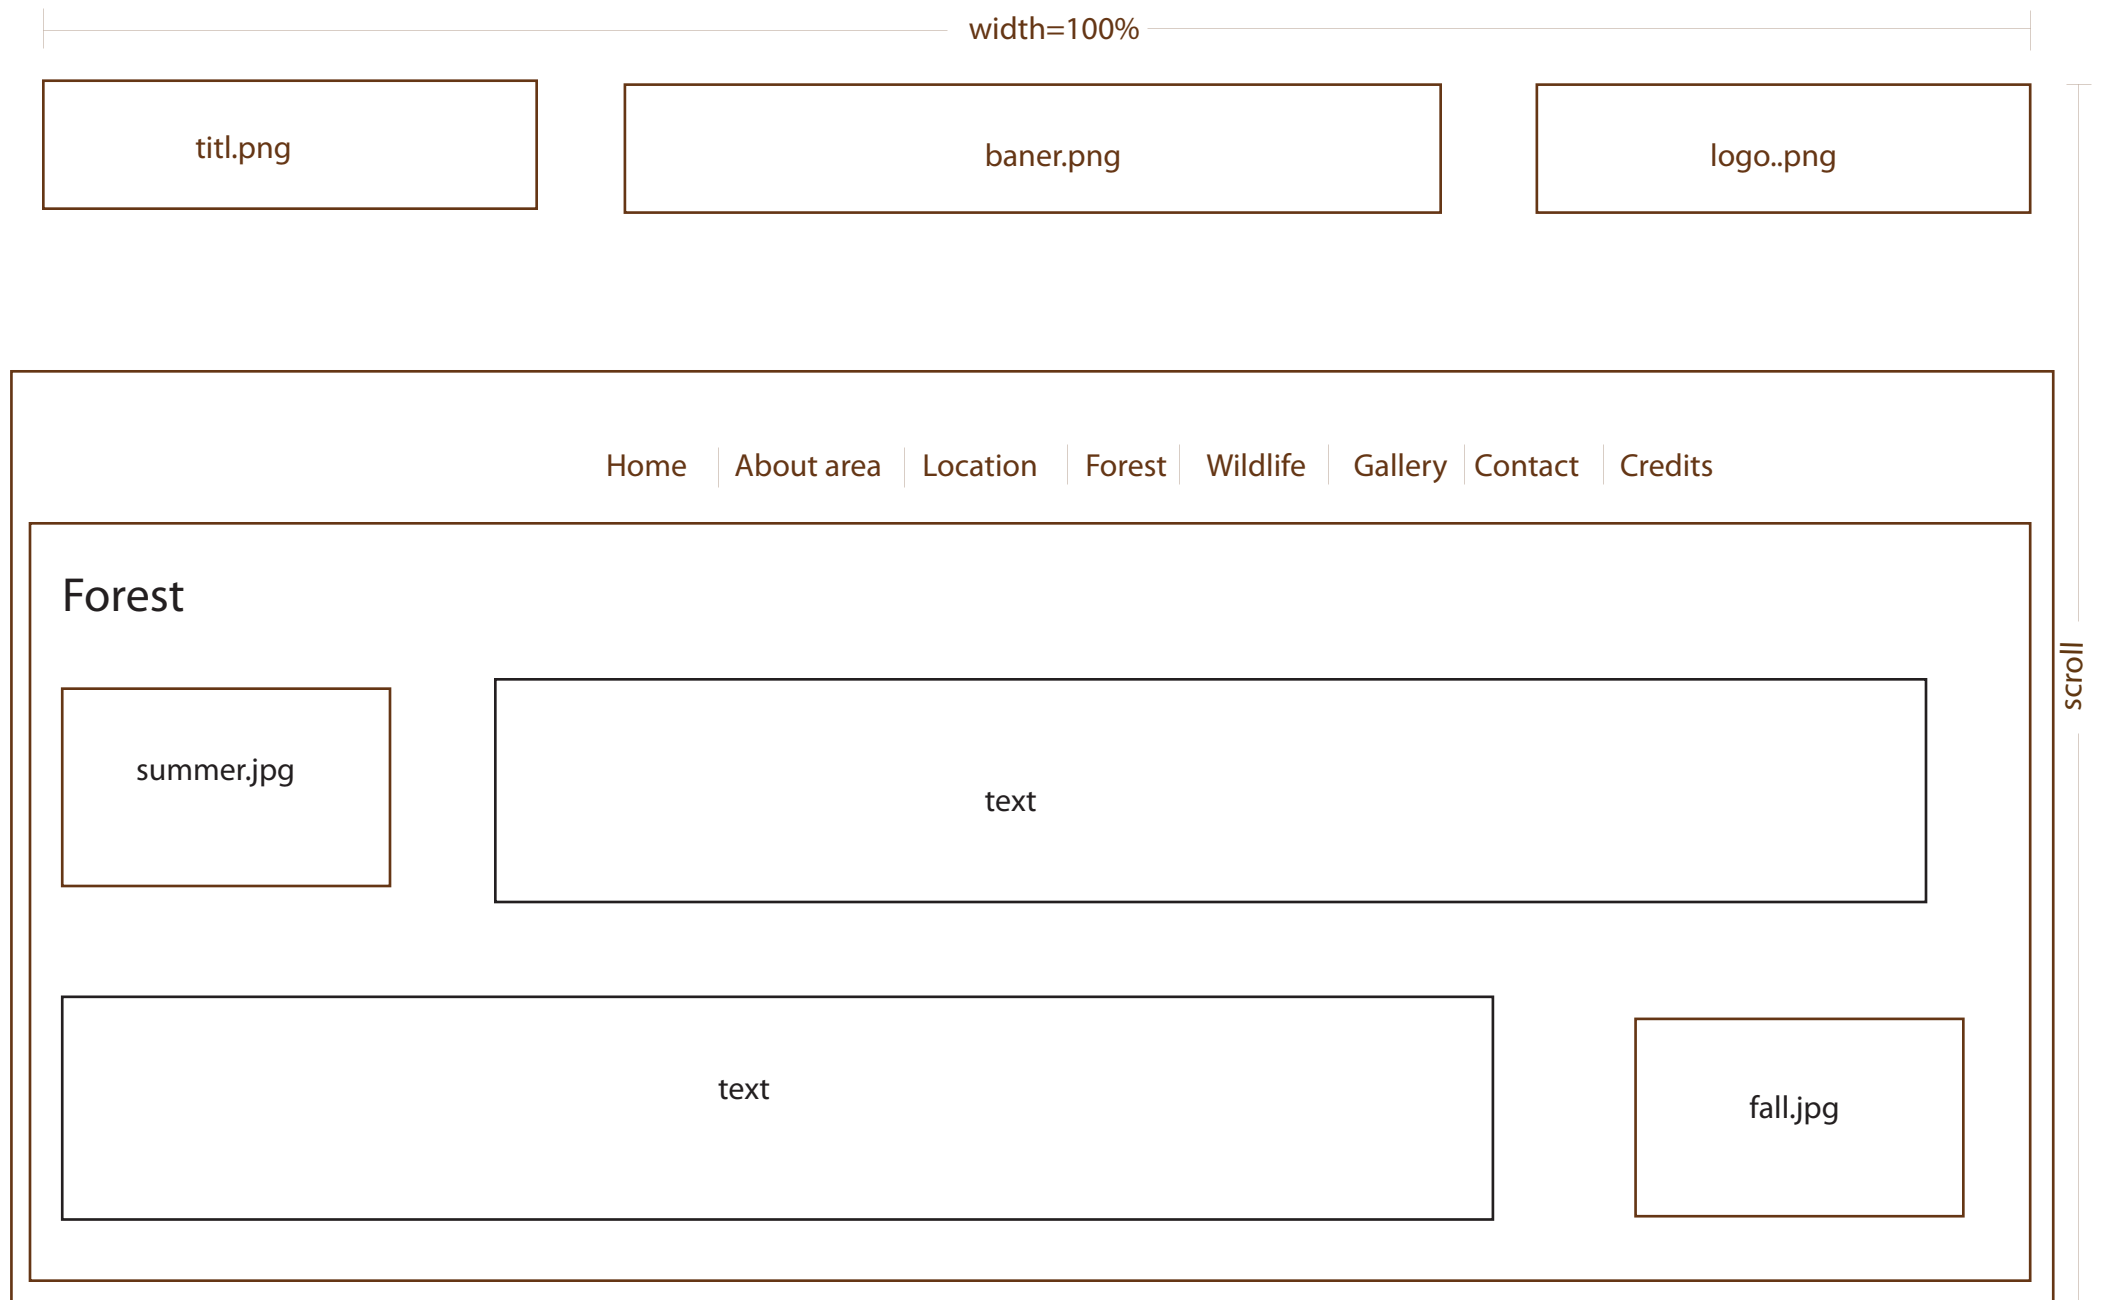

The most violent known eruption, which occurred 2.1 million years ago, ejected 588 cubic miles (2,450 km³) of volcanic material and created the rock formation known as the Huckleberry Ridge Tuff and created the Island Park Caldera.[51] A smaller eruption ejected 67 cubic miles (280 km³) of material 1.2 million years ago, forming the Henry's Fork Caldera and depositing the MesaFalls Tuff.

erruption.jpg

. In 2003, changes at the Norris Geyser Basin resulted in the temporary closure of some trails in the basin. New fumaroles were observed, and several geysers showed enhanced activity and increasing water temperatures. On March 10, 2004, a biologist discovered 5 dead bison which apparently had inhaled toxic geothermal gases trapped in the Norris Geyser Basin by a seasonal atmospheric inversion. # In April 2004 That discovering was closely followed by an upsurge of earthquake activity.
